Landing Page

Careers module:

New job seeker comes on landing page and click on a **careers** in **navbar** link which redirects to page showing different jobs posted by (HR), when user clicks on a job then it shows j**ob title, job description, experience required, job posting date, expiration date** and then **Apply now** button which take user to the form in which he fills basic details and uploads CV and clicks on submit (then this application goes to HR).

In (HR dashboard). Now HR view that application and can **call for an interview** or **reject**. In both situations email will be sent to that applicant which states (interview time, date) or a (rejection message).

HR Dashboard

Employee management module:
- Front end Completed (**need back-end functionality)**

Attendance Module:
- Front end Completed **(need back-end functionality)**

Leave Application Module:
- Front end Completed (need back-end functionality)

Job Applications Module:
- Front end Completed **(need back-end functionality as described above in careers module)**

Department Management Module:
- Front end Completed **(need back-end functionality)**

Employee Experience letter Module:
- When employee is leaving the company so HR should have a functionality to print him a experience letter in a pdf format which states (employee working years, months from the date of joining till the date he is leaving, employee job title and HR's remarks on him)
- Both Front-end and Backend functionality needed.

Salary Management Module:
(Both Front-end and Backend needed)
This module will allow HR manager to manage employee compensation and benefits. This module will calculate salary of an employee on the basis of number of presents in a month and then the HR can edit that salary if He/she wants and then there is approve button which send an email to that employee that salary has approved with the details of how the salay has been calculated.

<u>Employee Dashboard</u>

Attendance Management Module:
- Front end Completed **(need back-end functionality)**

Profile Management Module:
- Front end Completed **(need back-end functionality)**

Leave Application Module:
- Front end Completed **(need back-end functionality)**

<u>Login/Logout (authentication/authorization)</u>
- Front end Completed (need back-end functionality)

Note:
Almost all the front end is completed, we will provide you that react frontend file, you have to continue that project. You have to do all the backend part and the database **preferably (MongoDB)**. If there is a need to modify any frontend then you can edit that according to an understandable logic. Also add **comments** in the code which are easy to understand
At the end, We need all the things working perfectly and smoothly.
